Property Tracker Project

Project Description

You need to develop an application that tracks property details, including:

- **address**

- **city**

- **property_size**

- **owner_name**

- **property_type**

Each property will be identified with a **unique ID**.

Required Features

1. Users can **add new properties**.

2. Users can **view all registered properties**.

3. Users can **search properties** by either:

   - Unique ID

   - City name

4. Users can **update property information**.

Instructions

- You do **not** need to modify or manage:

  - Wallet

  - Admin

  - User configuration

- Do **not** change network configuration, `enrollAdmin.js`, or `registerUser.js`.

- Use these files as they are, similar to Lab7.

- For each transaction, you may reuse the existing code segments that gather:

  - Chaincode configuration path

  - Wallet data

  - Network and contract instances

To help your development further, we are providing a diagram and also a flow of query(getting data from API / chaincode) and a search feature based on our lab 07.
